0. Notation

Each flow is written as: **Step** → **Action** → **System Response** → **Next Step** / **Branch**. Decision points are marked with **[D]**. Error/edge-case branches are marked with **[E]**.

1. Guest vs Logged-in Entry Decision

Step	Action	System Response	Next
1	User lands on any page	Session checked for Firebase auth token	[D] Token valid?
2a	Yes → Logged-in state	Header shows account icon + name, cart/wishlist synced to account	Continue as authenticated
2b	No → Guest state	Header shows Login/Sign Up, cart stored in local/session storage only	Continue as guest — browsing, cart, wishlist* allowed

* Wishlist as guest is stored locally and prompted to merge into account on next login — do not block guest wishlist usage, but persist only after auth.

2. Core Shopping Flow

Step	Screen	Action	System Response	Next / Branch
1	Homepage	Browse category / search / click product card	Navigate to Product Listing or Product Detail	→ Step 2
2	Product Listing	Apply filter/sort	Grid re-renders, URL query params update	Stays on page
3	Product Detail	Select weight variant	Price updates to match variant	Stays on page
4	Product Detail	Click “Add to Cart”	[D] Stock available for selected qty/variant?	See Step 4a/4b
			Cart count badge	

4a	—	Yes	updates, confirmation toast, item added to cart state	Stays on page or → Cart
4b	—	No (out of stock) [E]	“Add to Cart” disabled, “Notify Me When Available” shown instead	User can enter email/phone for restock alert
5	Cart	Click “Proceed to Checkout”	[D] User logged in?	See Step 5a/5b
5a	—	Yes	→ Checkout	
5b	—	No	Redirect to Login, cart state preserved (not lost), post-login returns to Checkout	→ Auth Flow (Section 5)

3. Build Your Own Hamper — Full Wizard Flow

Step	Screen	Action	System Response	Next / Branch
1	Step 1 — Budget	Select/slide budget amount	Suggested product-count range shown	Continue enabled
2	Step 2 — Hamper Style	Select container (Basket/Box/Crate/Round Box)	Style price factored into running total	Continue
3	Step 3 — Products	Add/remove products from tabbed grid	[D] Running total ≤ budget?	See 3a/3b

3a	—	Within budget	“Continue” enabled, summary panel updates live	Continue to Step 4
3b	—	Exceeds budget [E]	“Continue” disabled or warning shown; user must remove items or increase budget (back to Step 1)	Blocked until resolved
4	Step 4 — Gift Card	Select card design, write message (150-char limit), optional recipient name	Live preview renders on the right	Continue
5	Step 5 — Preview	Review full hamper	[D] User action?	“Redesign Hamper” → back to Step 3; “Create Another Hamper” → new wizard instance added to cart, current one saved; “Confirm & Proceed” → Step 6
6	Step 6 — Confirm	Hamper added to cart as a single line item	[D] Logged in?	Same branch as Section 2, Step 5

Edge case [E]: If user abandons mid-wizard (closes tab), wizard state persists in session for re-entry within the same session only — do not persist indefinitely without login.

4. Search Flow

Step	Action	System Response	Next / Branch
1	User types in search bar	Live suggestions dropdown (products, categories) after 2+ characters	[D] User selects suggestion or presses Enter
2a	Selects suggestion	Navigate directly to that Product/Category page	End
2b	Presses Enter	→ Search Results Page with query	See Step 3
3	Search Results Page	[D] Results found?	3a: Yes → grid shown, filters available (same as Product Listing). 3b: No [E] → “No results found” state with suggested categories/best-sellers shown, not a dead end

5. Authentication Flow

Step	Screen	Action	System Response	Next / Branch
1	Login	Enter email/phone + password, or choose OTP login	[D] Method?	1a: Password → Step 2. 1b: OTP → Step 3
				2a: Yes → Dashboard/return-to-origin. 2b: No

2	—	Submit password	[D] Credentials valid?	[E] → inline error, no indication of “email not found” vs “wrong password” (prevents user enumeration)
3	—	Enter phone/email for OTP	Firebase sends OTP	→ OTP Verification screen
4	OTP Verification	Enter code	[D] Code valid + not expired?	4a: Yes → logged in, return-to-origin. 4b: No [E] → error, “Resend OTP” with cooldown timer (rate-limited)
5	Login → “Forgot Password”	Enter registered email	Firebase sends reset link	Confirmation screen: “Check your email” — do not confirm/deny if email exists (enumeration protection)
6	Sign Up	Enter name, email/phone, password	[D] Email/phone already registered?	6a: No → account created, verification sent. 6b: Yes [E] → “Account exists, log in instead” prompt with direct link to Login

6. Checkout & Payment Flow

Step	Screen	Action	System Response	Next / Branch
		Select/add	Address validated	

1	Checkout	delivery address	(pincode serviceable check)	[D] Serviceable?
1a	—	Yes	Continue	→ Step 2
1b	—	No [E]	“We don’t deliver to this pincode yet” — block progression, allow choosing a different address	Blocked
2	Checkout	Select delivery date	Available dates shown based on courier capacity	→ Step 3
3	Checkout	(Optional) Fill gift recipient details	Stored against order, not user profile	→ Step 4
4	Checkout	Select payment method	→ Step 5	
5	Checkout	Click “Place Order Securely”	Order created in pending state; redirect to payment gateway (hosted checkout — card data never touches Sukhmal’s server)	→ Step 6
6	Payment Gateway	User completes payment	Gateway sends server-to-server webhook (not just frontend redirect) confirming payment status	[D] Payment status per webhook
6a	—	Success	Order status → confirmed , stock	→ Order

			decremented, confirmation email/SMS sent	Success page
6b	—	Failed [E]	Order status → payment_failed , stock NOT decremented	→ Order Failed page with “Retry Payment” (re-attempts Step 5, same order ID, does not create duplicate order)
6c	—	Timeout / user abandons gateway [E]	Order remains pending for a defined window (e.g., 15 min), then auto-cancelled if no webhook received	Cart items restored for user to retry

Critical rule: Order confirmation must be driven by the **payment gateway webhook**, never by the frontend “success” redirect alone — frontend redirect can be spoofed/interrupted, webhook cannot.

7. Order Lifecycle & Logistics/Tracking Flow

Step	Trigger	System Action	User-Visible Result
1	Payment confirmed	Order status: Confirmed	Order Success page, appears in My Orders
2	Admin/warehouse marks packed	Order status: Packed	Track Order page updates
3	Courier picks up, tracking ID	Order status: Shipped	Tracking ID + courier name shown on Track

	assigned		Order
4	Courier webhook/API update	Order status: Out for Delivery	Push/SMS notification sent
5	Delivery confirmed	Order status: Delivered	Notification sent, "Return/Replace" option becomes available for a defined window
—	[E] Delivery failed/returned by courier	Order status: Delivery Failed	User notified, support/reschedule flow triggered

Track Order lookup flow: Order ID entered → [D] Valid ID? → Yes: full timeline shown (public, no login needed) → No **[E]**: "Order not found, check your ID" — no account/personal info ever exposed to a wrong/guessed ID beyond what's on the order itself.

8. Return / Cancellation Flow

Step	Action	System Response	Next / Branch
1	My Orders → order → "Return/Cancel"	[D] Order status?	1a: Not yet shipped → full cancel allowed, instant refund initiated. 1b: Shipped/Delivered [E] → return flow (reason selection, pickup scheduling), not a simple cancel
2	Return reason submitted	Request status: Pending Review (admin sees in Admin → Orders)	Notification sent to user
			3a: Yes → pickup scheduled, refund initiated post

3	Admin approves/rejects	[D] Approved?	pickup confirmation. 3b: No [E] → reason shown to user, support contact offered
---	------------------------	---------------	--

9. AI Feature Flows

9.1 AI Image Generation (Homepage widget)

Step	Action	System Response	Next / Branch
1	User types hamper description	Submit to image-gen API	Loading state shown
2	—	[D] Generation successful?	2a: Yes → preview image shown, “Build This Hamper” CTA links into Build-Your-Own wizard (pre-filled where possible). 2b: No [E] → friendly retry message, does not silently fail
—	Rate limiting [E]	If user spams requests	Cooldown/limit message, prevents API cost abuse

9.2 Gift Advisor Assistant (chat widget)

Step	Action	System Response	Next / Branch
1	User opens chat, states occasion/budget/relationship	Assistant (via AI Assistant API) asks clarifying questions if	→ Step 2

		needed	
2	Assistant recommends product(s)/hamper(s)	Product cards rendered inline in chat with “Add to Cart” / “View” actions	User can act directly from chat, no forced page navigation
—	[E] API unavailable/timeout	Fallback message: “Assistant unavailable, browse Gift Hampers instead” with direct link	Never a dead-end chat

10. Admin Panel Flows

10.1 Admin Login

Step	Action	System Response	Next / Branch
1	Admin navigates to /admin	[D] Has admin custom claim (Firebase)?	1a: Yes + valid session → Admin Dashboard. 1b: No [E] → redirected to standard customer Login, no distinct “admin login” page exposed publicly (avoids revealing admin surface)
2	Admin logs in with credentials	[D] Role claim = admin?	2a: Yes → Dashboard. 2b: No [E] → treated as regular customer login, no error revealing “you tried to access admin”

10.2 Product Management

Step	Action	System Response	Next / Branch
1	Admin → Products → “Add Product”	Form: name, category, images, variants/weights, price, stock, description	→ Step 2
2	Submit	[D] Validation passed?	2a: Yes → product saved, live on storefront immediately or as “draft” (confirm with PRD). 2b: No [E] → inline field errors
3	Admin → edit/deactivate existing product	Changes reflected on storefront; deactivated products removed from listing but preserved in past order records	—

10.3 Order Management

Step	Action	System Response	Next / Branch
1	Admin → Orders → filter by status	Order list updates	→ Step 2
2	Admin updates order status (Packed/Shipped)	Status change propagates to customer’s Track Order page in real time	→ triggers Section 7 flow
3	Admin views/approves Return requests	→ Section 8, Step 3	

10.4 Inventory Management

Step	Action	System Response	Next / Branch
1	Stock level edited manually, or auto-decremented on order confirm	[D] Stock reaches 0?	1a: Yes → product auto-marked “Out of Stock” on storefront. 1b: Low-stock threshold reached [E] → admin alert/notification
—	[E] Concurrent orders for last unit	Stock check + decrement must be atomic (single transaction)	Prevents overselling the same last unit to two simultaneous buyers

10.5 Customer & Coupon Management

Step	Action	System Response
1	Admin views customer list/order history	Read access only — no raw password/payment data ever visible to admin
2	Admin creates coupon (code, %/flat discount, validity, min order value)	Coupon becomes usable at Cart/Checkout, validated server-side at apply time (not just frontend)

11. Cross-Cutting Edge Cases (apply across all flows)

Scenario	Required Behavior
Session expires mid-checkout	Save cart/form state, prompt re-login, return user to exact same checkout step — never lose entered data
Item goes out of stock while in cart	Flag at Cart and again at Checkout (re-validate stock right before payment, not just at add-to-cart time)
